

Industrial Internship Report

Project: Smart Customer Churn Prediction System using Machine Learning

Prepared By: Pandrakola Tharuni

Course: B.Tech CSE (Data Science)

Preface

This report summarizes the 4-week internship work focused on Data Science and Machine Learning.

Introduction

Customer churn prediction helps businesses identify customers likely to discontinue services.

Problem Statement

Develop a machine learning system that predicts whether a telecom customer will churn.

Existing and Proposed Solution

A Random Forest based churn prediction model was developed using Python.

Design / Model

Data Collection -> Data Cleaning -> EDA -> Model Training -> Prediction

Performance Test

The model produced successful churn predictions in VS Code.

My Learnings

Learned data preprocessing, probability, statistics, and machine learning fundamentals.

Future Scope

Can be improved using larger datasets and deployment using Streamlit.
